Tim Kindberg

Distributed Systems:
Concepts and Design
Edition 4, © Addison-Wesley 2005

1/20/2011

1

Definition of a Distributed System

- ⌘ **G. Coulouris, J. Dollimore, T. Kindberg: A system in which hardware and software components located at networked computers communicate and coordinate their actions only by message passing**
- ⌘ **A. Tanenbaum and M. Steen: a collection of independent computers that appears to its uses as a single coherent system**

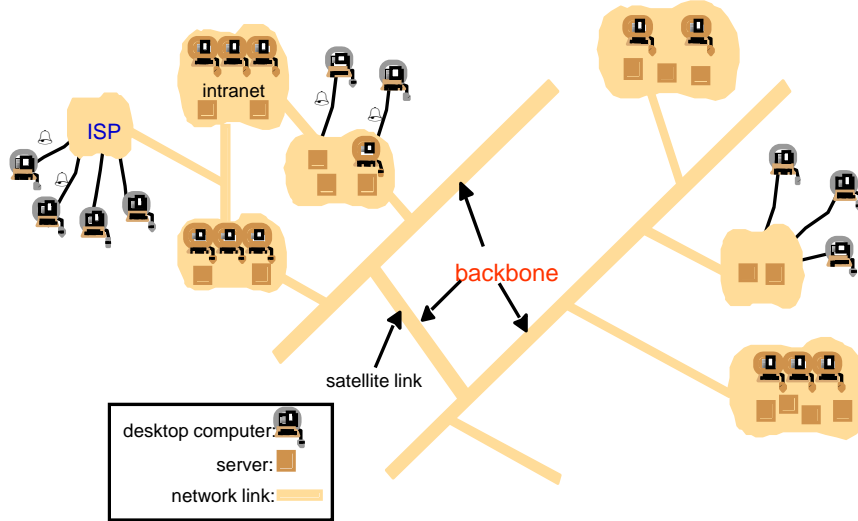

**Core Objective:
Resource Sharing**

1/20/2011

2

The Internet: fostering distributed computing

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

3

A Typical Intranet

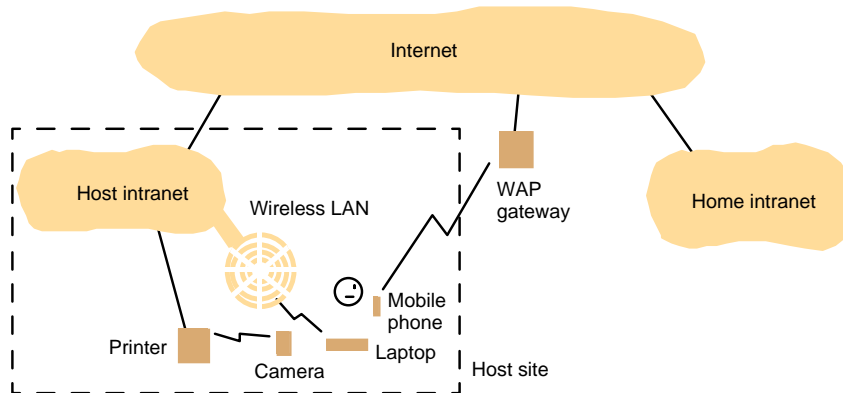

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

4

Mobile Computing

- ⌘ **Mobile computing: increasing the capability of moving computing services with us; computing model does not change**

Portable and handheld devices in a distributed system

1/20/2011

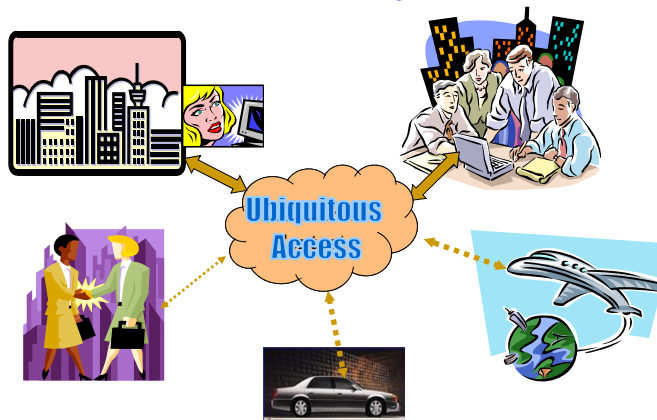

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

5

Ubiquitous/Pervasive Computing

- ⌘ Anytime/Anyplace Computing

- ☑ help organize and mediate social interactions wherever and whenever these situations might occur

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

6

History and Evolution

⌘ Changing Forces

- ☒ Wireless telecommunication capabilities
- ☒ Open networks
- ☒ Continued increases in computing power
- ☒ Improved battery technology
- ☒ Emergence of autonomous software infrastructures

⌘ Mobile Computing + Embedded Computing

- ☒ Mobile computing: increasing the capability of moving computing services with us; computing model does not change
- ☒ Embedded computing: increasing the capability of obtaining information from its environment and utilize it to dynamically build computing models, less level of mobility

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

7

Cloud Computing

⌘ Aims to offer IT capabilities over the Internet as an on-demand, pay-per-use service.

- ☒ Data centers / high-density servers
- ☒ Server virtualization
- ☒ Service-oriented architecture
- ☒ Pay-as-you-go business model
- ☒ Emerging autonomic resource management techniques

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

8

Autonomic Computing

⌘ Seeks to improve computing systems with an aim of decreasing human involvement

☒ Computing systems have reached a level of complexity where the human effort required to get the systems up and running and keeping them operational is getting out of hand. [ACM Computing Surveys 2008]

☒ Think about the telephony in 1920s. Automatic branch exchanges were introduced to eliminate the need for human intervention.

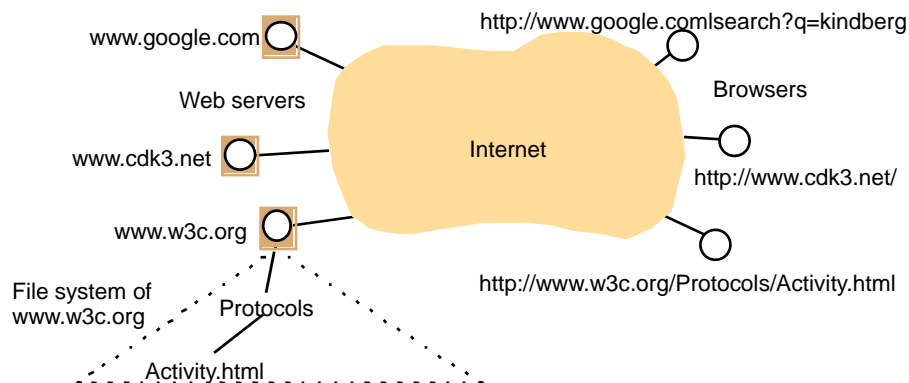

Dr. Zhou, Jan 2011

9

Resource Sharing: Web Servers and Web Browsers

⌘ WWW: an evolving **open** system for publishing and accessing resources and services across the Internet

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

10

Key Characteristics of Distributed Systems

- ⌘ **Raise three key characteristics of distributed systems**
- ⌘ **Concurrency: concurrent program execution and resource access**
 - ☒ How to coordinate actions?
- ⌘ **No global clock: the limits to the accuracy with which the computers in a network can synchronize their clocks**
 - ☒ The only communication is messaging passing
- ⌘ **Independent failures: each component of the system can fail independently, leaving the others still running**
 - ☒ How to tell if the network has failed or become unusually slow?
 - ☒ How to know if a remote server crashed immediately?

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

11

Heterogeneity

- ⌘ **Applies to all of the following:**
 - ☒ **Networks**
 - ☒ Internet protocols mask the differences between networks
 - ☒ **Computer hardware**
 - ☒ e.g. data types such as integers can be represented differently
 - ☒ **Operating systems**
 - ☒ e.g. the API to IP differs from one OS to another
 - ☒ **Programming languages**
 - ☒ data structures (arrays, records) can be represented differently
 - ☒ **Implementations by different developers**
 - ☒ they need agreed standards so as to be able to interwork

1/20/2011

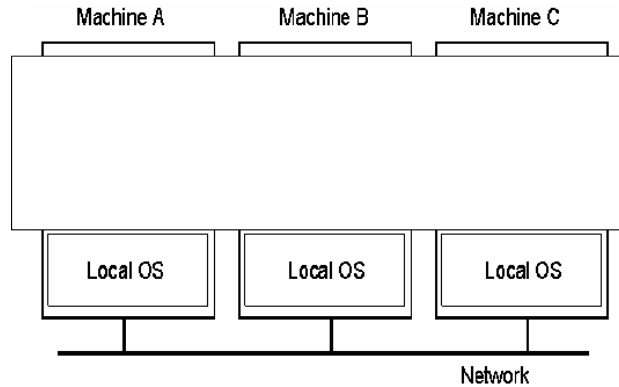

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

12

Challenges and Issues: Heterogeneity

⌘ **Middleware: a software layer that provides a programming abstraction as well as masking the heterogeneity of the underlying networks, hardware, OS, and programming languages.**

☒ Example: CORBA, Java RMI

1/20/2011

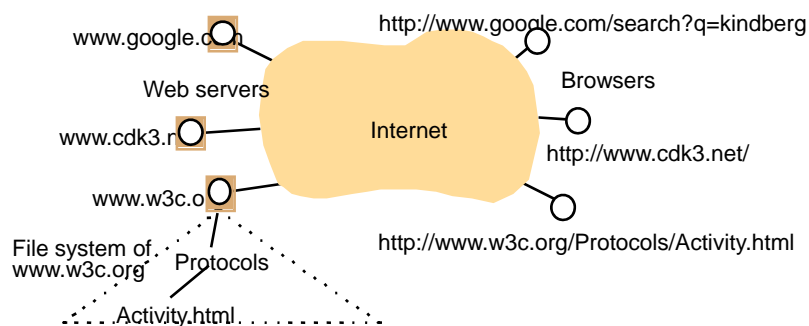

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

13

Challenges and Issues: Openness

⌘ **Openness: whether the system can be extended and re-implemented in various ways and new resource-sharing services can be added and made available for use by a variety of client programs**

- ☒ specification and documentation of key software interface must be published
- ☒ Example: Web, which can be extended and implemented in new ways without disturbing its existing functionality; [an open distributed system](#)

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

14

Challenges and Issues: Security

⌘ Resource (information) sharing leads to security issue

- ☒ Confidentiality (protection against unauthorized individuals)
- ☒ Integrity (protection against alternation)
- ☒ Availability (protection against interference with resource access)
- ☒ Working encryption techniques for authentication
- ☒ Still challenges: DoS/DDoS, Mobile code, Flash Crowds

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

15

Challenges and Issues: Scalability

⌘ Scalable: remain effective when there is a significant increase in the number of resources and the number of users

<i>Date</i>	<i>Computers</i>	<i>Web servers</i>
1979, Dec.	188	0
1989, July	130,000	0
1999, July	56,218,000	5,560,866
2003, Jan	171,638,297	35,424,956

<i>Date</i>	<i>Computers</i>	<i>Web servers</i>	<i>Percentage</i>
1993, July	1,776,000	130	0.008
1995, July	6,642,000	23,500	0.4
1997, July	19,540,000	1,203,096	6
1999, July	56,218,000	6,598,697	12
2003, July		42,298,371	

1/20/2011

16

Scalability Problems

Concept	Example
Centralized services	A single server for all users
Centralized data	A single on-line telephone book
Centralized algorithms	Doing routing based on complete information

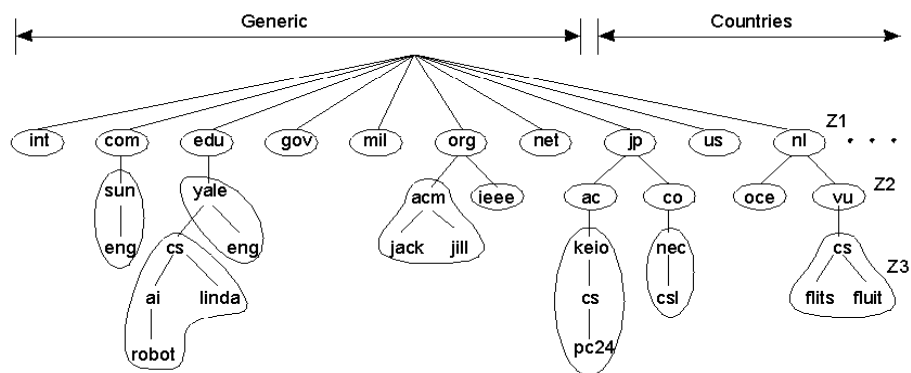

- ⌘ Controlling the cost of physical resources: linear $O(n)$?
- ⌘ Controlling the performance loss: centralized data \rightarrow hierarchic $O(\log n)$
- ⌘ Preventing software resources running out: IP address 32-bit \rightarrow 128-bit
- ⌘ Avoiding performance bottlenecks: centralized vs. decentralized.

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

17

Scaling Techniques: Centralized vs Decentralized

An example of dividing the DNS name space into hierarchical zones

Raise more example(s) from network routing?

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

18

Challenges and Issues: Failure Handling

- ⌘ Partial / independent failures
 - ☒ some components fail while others continue to function
- ⌘ Detecting failures:
 - ☒ hard job, even impossible, **why?**
 - ☒ **how to behave under suspected (not detected) failures?**
- ⌘ Masking failures: hid the detected failures
 - ☒ message retransmitting; data replication
- ⌘ Tolerating failures and redundancy
 - ☒ multi-path routing in the Internet
 - ☒ replication in the Internet servers
- ⌘ Failure recovery
 - ☒ **consistency due to incomplete actions?**

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

19

Challenges and Issues: Concurrency

- ⌘ Resources are shared concurrently by clients
 - ☒ An object's operations must be **synchronized** so that its data remains consistent
 - ☒ E.g., Semaphores

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

20

Challenges and Issues: Transparencies

System is perceived as a whole rather than a collection of independent components

Access transparency: enables local and remote resources to be accessed using identical operations.

Location transparency: enables resources to be accessed without knowledge of their location.

Concurrency transparency: enables several processes to operate concurrently using shared resources without interference between them.

Replication transparency: enables multiple instances of resources to be used to increase reliability and performance without knowledge of the replicas by users or application programmers.

Failure transparency: enables the concealment of faults, allowing users and application programs to complete their tasks despite the failure of hardware or software components.

Mobility/migration transparency: allows the movement of resources and clients within a system without affecting the operation of users or programs.

Performance transparency: allows the system to be reconfigured to improve performance as loads vary.

Scaling transparency: allows the system and applications to expand in scale without change to the system structure or the application algorithms.

22

Distributed vs. Centralized Systems

⌘ Advantages of Distributed Systems

- ⊠ Resource sharing
- ⊠ Reliability
- ⊠ aggregate computing power
- ⊠ scalability / openness

⌘ Disadvantage of Distributed Systems

- ⊠ Security
- ⊠ computing power per node is limited

What is a Parallel System?

⌘ A parallel system is a collection of *processing elements* that cooperate to solve large problems fast

⌘ Some broad issues

- ⊠ resource allocation
 - ⊠ How large a collection (how many elements)?
 - ⊠ How powerful are the processing elements
- ⊠ data access, communication and synchronization
 - ⊠ How do the elements cooperate and communicate?
 - ⊠ How are data transmitted between processors?
 - ⊠ What are the abstractions and primitives for cooperation?
- ⊠ Performance and Scalability
 - ⊠ How does it all translate into performance
 - ⊠ How does it scale?

Speedup - Amdahl's Law

ExTime after improvement = ExTime unaffected +
ExTime affected / amount of improvement

Speedup due to enhancement E:

$$\text{Speedup}(E) = \frac{\text{ExTime w/o E}}{\text{ExTime w/ E}} = \frac{\text{Performance w/ E}}{\text{Performance w/o E}}$$

25

Shared-Memory Architectures

⌘ Examples: Cray C90, SGI Power Challenge

1/20/2011

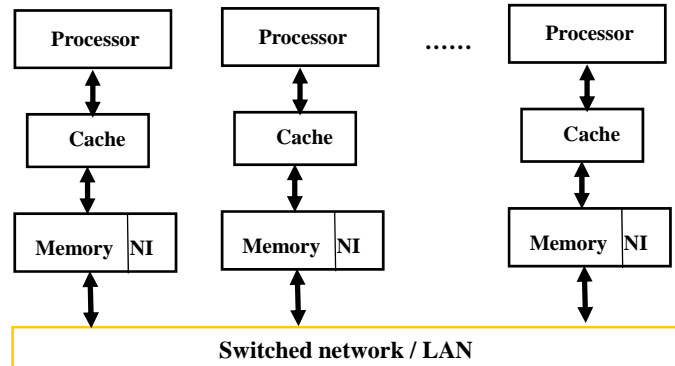

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

26

Distributed (Multi-Private) Memory Architectures

⌘ Examples:

- ⊠ NUMA: Cray T3E , SGI Origin 2000 (connected on memory bus)
- ⊠ UMA: Sun Enterprise 10000 (connected on memory bus)
- ⊠ Clusters: IBM SP-2, UC Berkeley NOW (connected on I/O bus)

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

27

Distributed Shared Memory

- ⊠ Build a “virtual” memory address over distributed multiple physical memories; an **abstraction** for data sharing between computers that do not share physical memory
 - ⊠ Load/store vs. send/receive message passing
 - ⊠ Run-time system support for transparent accesses

28

Modern Data Centers

⌘ Data centers are the next computing platform

- ☒ Power consumption, distribution and cooling are major components in a data center's cost breakdown.

In 2009, we built a university prototype data center for research with a \$1.25M equipment grant from the Air Force. The expenditure in racks, 24 HP G6 blade servers, 40 TB HP EVA storage area network with 10Gbps Ethernet and 8Gbps Fibre/iSCSI dual channels and the VMware licenses was about \$0.6 million, while the expenditure in three APC InRow RP Air-Cooled and UPS equipments for maximum 40 kW in the n+1 redundancy design was about another \$0.6 million.

31

Distributed Operating Systems

⌘ Requirements

- ☒ Provide user with a single coherent computer system
- ☒ Hide distribution of resources
- ☒ Mechanisms for resource protection
- ☒ Secure communication

⌘ Definition of Distributed OS

- ☒ Look to user like ordinary centralized OS, but runs on multiple and independent CPUs
 - ☒ use of multiple processors is invisible
 - ☒ user views system as a virtual uniprocessors

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

32

Network Operating System

- ⌘ A collection of OSs of computers connected through a network incorporating modules to provide access to remote resources
 - ☒ Users are aware of file locations; remotely log-in

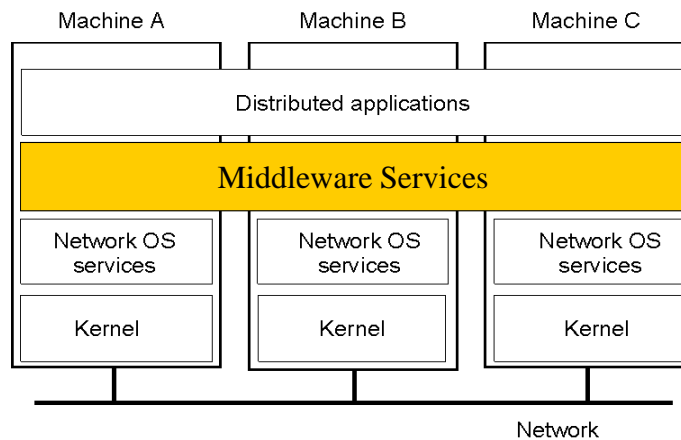

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

33

Distributed OS: Positioning Middleware

- ⌘ General structure of a distributed system as middleware.

1/20/2011

Adapted from Distributed Systems: Concepts and Design Edn. 4
© Addison-Wesley Publishers 2005

34

Distributed vs. Networked Operating Systems

⌘ Transparency

- ☒ how aware are users of the fact that multiple computers are being used?

⌘ Network OS

- ☒ Users are aware where resources are located
- ☒ Network OS is built on top of centralized OS
- ☒ Handles interfacing and coordination between local OSs

⌘ Distributed OS

- ☒ Designed to control and optimize operations and resources in distributed system, but giving a virtual single system to users

Learning Summary

⌘ the key characteristics of distributed systems

- ☒ concurrency
- ☒ independent failure of components
- ☒ lack of a global clock

⌘ the key challenges in distributed systems

- ☒ heterogeneity
- ☒ openness
- ☒ security
- ☒ scalability
- ☒ failure handling
- ☒ concurrency
- ☒ transparency
